

Amendments to the Specification:

Please amend paragraph 37 on page 9 as follows:

[0037] Once one of the levels of a progressive game has been paid out, that level resets itself to the base amount, at step 76. The other progressives that did not pay out keep increasing until someone wins that progressive jackpot. The progressive jackpots are created by a base amount being put into the pot (e.g., \$1,000 for the mini, \$3,000 for the maxi, and \$5,000 for the mega). Then, every time one of the gaming terminals 10a, 10b, 10c, 10d in the system 28 is played, a percentage of the amount wagered is placed into each of the progressives. In some embodiments, 1% may go to the mini progressive, $\frac{1}{2}\%$ ~~12%~~ to the maxi progressive, and $\frac{1}{4}\%$ ~~14%~~ to the mega progressive. Because the maxi progressive and the mega progressive pay out less often than the mini progressive, less money needs to go to fund these progressives.
